VERTICAL TAKE-OFF AND LANDING (VTOL) AIRCRAFT - UCL TEAM NOVA

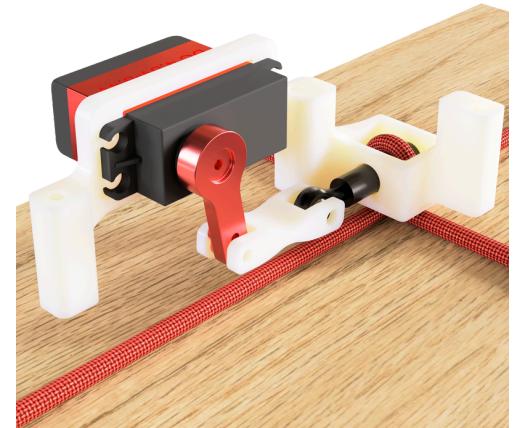

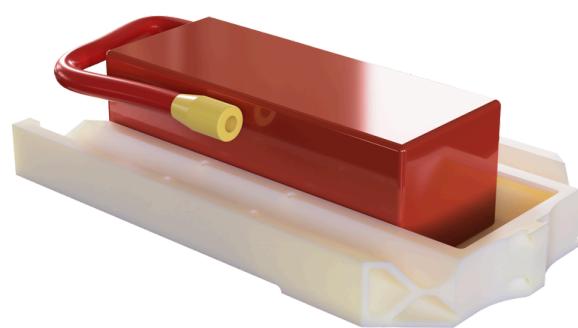

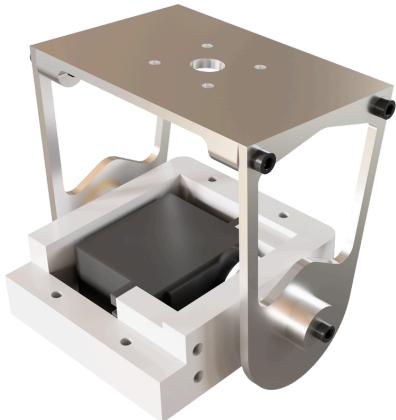

What?

Develop the flight controls & electronics for a VTOL aircraft capable of autonomous take-off and landing, flight, navigation, and payload delivery.

How?

- **3D printed** battery housing using PAHT-CF
- Created **CNC toolpaths** to machine the aluminium propulsion mounts of the front two motors
- Programmed differential thrust for yaw control
- Manufactured a **test rig** to evaluate propulsion mount performance under a maximum thrust load of 46N, supported by a detailed indoor test **risk assessment**
- Designed a servo-actuated payload release system with 3D printed mechanical linkage connecting a pull rod to the servo horn
- Implemented a digital BDShot protocol to achieve higher baud rates, reduce communication noise, and improve aircraft responsiveness
- Performed real-time and post-flight analysis of logged flight data using **MATLAB**

REPEATABLE VEHICLE - IMECE DESIGN CHALLENGE (2024)

What?

Design a repeatable vehicle capable of precise and accurate target detection and parking

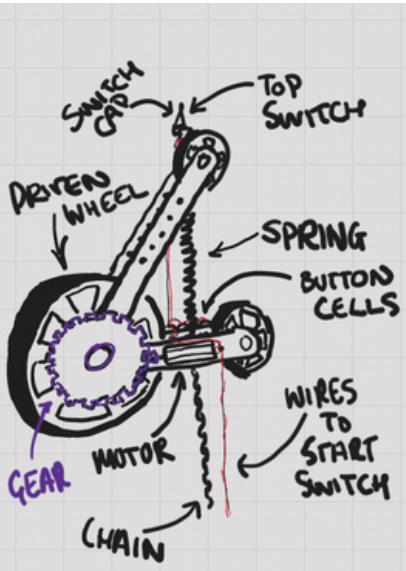

How?

- Defined vehicle geometry using **MATLAB** model
- Nested laser cutting with acrylic sheets
- PCB Design** using **EasyEDA**
- Modelled chassis deflections using **FEA** in **Ansys Mechanical**

Results

- 25% cost reduction
- 30% material waste reduction
- 95% accuracy, thereby winning nationals

INTERNAL PIPE CLIMBER - IMECE DESIGN CHALLENGE (2023)

What?

Design and manufacture a self-contained pipe climbing robot that can travel up and down a vertical distance of 2.2m while carrying a 2.5m long chain

How?

- Laser-cut** plywood structural frame
- 3D Printed** Wheels & Pulley Gear System
- Nitrile O-rings for optimal grip
- DPDT switch reverses motor

Results

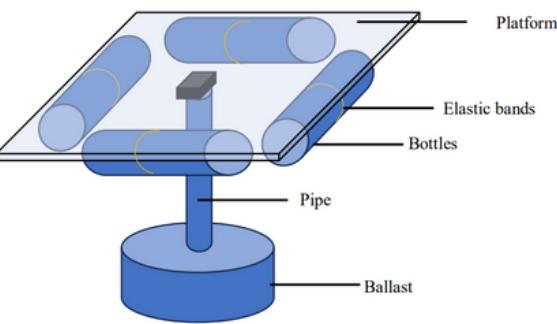

47-second run-time, placing 3rd in overall competition at UCL

OFFSHORE PLATFORM - OCEAN ENGINEERING (UCL MODULE)

What?

Design and manufacture an offshore floating platform capable of resisting increasingly larger waves without capsizing

How?

- Developed a sensor fusion algorithm through **MATLAB** to obtain roll and pitch readings using Arduino Nano
- Performed hydrostatic and stability calculations

Results

- Ranked 2nd amongst the cohort.
- Awarded prize for most sustainable design

BIOSAND FILTRATION DEVICE - HOW TO CHANGE THE WORLD CHALLENGE

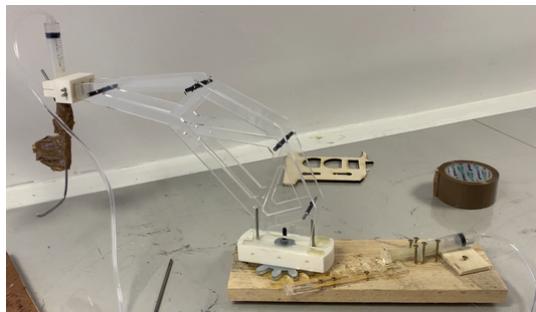

What?

Design a household-level water collection and treatment system

How?

- Designed **3D CAD model** of biosand filter; made from an HDPE plastic container filled with sand and gravel
- Modular design allows removable trays for ease of maintenance and replacement

HYDRAULIC ROBOTIC ARM - AUTODESK MECHATHON CHALLENGE

What?

Design a syringe-operated hydraulic arm to move increasingly heavier boxes.

How?

- 3D Printed** PLA base and grip holder
- Laser-cut** acrylic structural frame, pinion and gear
- Designed **3D CAD model** on **Fusion 360**
